ABSTRACT

Drug addiction is becoming Challenging/dangerous/critical habit for physical as well as mental health. Drugs contain such kind of ingredients & chemicals which is responsible for changes in the functions of the brain and it can be raised abnormal behaviours i.e., depression, stress, etc. because of these things this topic is very important to study. The objective of the present study was compared to depression, stress, and happiness among drug addicts and non-drug addicts. In the study, 30 drug addicts, those were admitted

in a rehabilitation Centre located in Chandigarh (India) and 30 non-drugs addicts' people who were not using any kind of drug were included. Depression, stress, and happiness were assessed by psychological tests, i.e., the beck depression inventory, perceived stress scale, and the Oxford happiness inventory. To find out the results descriptive statistics, t-test was used, the results showed that drug addicts significantly differ from non-drug addicts on the basis of the above-mentioned variable. In the end of the study, it can be concluded that drug addicts should have to take healthy ways to cope up with their psychological issues.

Key Words: *Drug addicts; Non drug addicts; Depression; Stress; Happiness*

INTRODUCTION

Illicit drug use is a not kidding issue in this day and age. There are numerous social, mental elements which add to fixation. Drug junkie individual relies upon the complicated medication individual-society relationship it implied that society is assuming an extremely essential part to turn into a medication someone who is addicted. DSM-IV-TR has given a definition "continuous use and expanded reliance on a substance that cause side effects of inconvenience and hardship that truly wants to reuse the material". Such countless mental states are liable for illicit drug use; it incorporates eliminating torment, disagreeable state, wretchedness or stress. Utilization of medications can decrease in these psychological states yet for the present moment just or these are some unacceptable technique, it can give remember. As we said before mental state despondency and stress are extremely normal mental problems among drug addicts. Under the rules of significant burdensome issue, drug addicts are involved. Wretchedness can be considered as varieties of side effects like bitterness, uneasiness, terribleness, defencelessness, and so on from seven days to months, years. A discouraged individual frequently sensations of culpability, and uselessness and these side effects can cause to substance addiction. Selye has characterized pressure as a condition when an individual vibe compelled to accomplish something strongly, it tends to be intellectually, truly, or inwardly, and any reason which prompts pressure called boost and stress is a primary variable in the improvement of illicit drug use. Joy might be characterized as the circumstance in which an individual communicates delight and satisfaction. It is the condition where pessimistic pressure degrees are at the little, regardless of whether not zero and positive pressure work on the individual's positive feelings. Remain cheerful is one of the most fundamental necessities of living. Since the send-off of the human progress, man has additionally been attempting to foster new innovations, make new apparatuses and work on his way of life for the sole motivation behind accomplishing bliss. Albeit, in this race of logical endeavour and chasing after cash and extravagances, man is not really aware of what truly make bliss. In this current review, drug addicts were incorporated, all male patients who were conceded in drug de-environment and restoration focus situated at area 18 Chandigarh and other non-drug addicts guys implies those individuals who were not utilizing any sort of medication, and information was directed from Chandigarh. According to past examinations, men were higher on drugs than ladies, it was important to do the exploration on men just, and greatest investigations were done on puberty, grown-ups. Moral freedom was acquired from the recovery community specialists and informed assent was gotten from the patients (drug addicts) as well as from the individual who were non drug addicts. Purposive testing method was utilized to choose the example of 30 patients inside the age scope of 19 years to 40 years and different gatherings were 30 non drug addicts inside a similar age range.

In the review, maniacal cases were prohibited, in light of the fact that they unfit to appropriately answer. A few mental devices were regulated, first was, The Beck Depression Inventory (BDI), it contains 21-thing; self-report rating stock that actions trademark mentalities and side effects of wretchedness. T

CONCLUSION

Structure the above conversation it is presumed that there is a contrast between drug addicts and non-drug addicts based on certain factors i.e., sadness, stress, and bliss. Drug addicts are high on sadness, stress however coming up short on joy.
